

Mobile App User Experience

Introduction

This project is focused on analysing customer experience data from a mobile application. The dataset includes feedback on different sections of the app, crash reports, session duration, and user ratings across devices and regions.

Dataset

The dataset consists of 5000 records with the following columns:

1. user_id: Unique identifier for each user
2. state: User's state (geographical location)
3. device_type: Device used - Android or iOS
4. app_section: App area being used (Home, Search, Profile, etc.)
5. experience_rating: User rating for that app experience (1-5)
6. feedback_tag: Type of feedback given (e.g., Slow Loading, Great UI)
7. session_duration_sec: Length of the session in seconds
8. is_crash: Whether the app crashed during the session (1 = Yes, 0 = No)

Business problems / questions

1. Which app section receives the highest and lowest average ratings overall?
2. Which app section has the highest number of user interactions (count of sessions)?
3. How does the average rating vary by state?
4. Do users who experience crashes leave lower ratings consistently across all states?
5. Which device type tends to experience more crashes?
6. Is there a significant rating difference for the same app section between Android and iOS users?
7. Are there differences in ratings between Android and iOS users?
8. Is there any relationship between app crashes and low ratings?
9. Which state has the most satisfied users?
10. Which states experience the most crashes?
11. Which app section has the most crashes on iOS vs. Android?
12. Which feedback tags are most frequently associated with crashes?
13. What feedback tags are most associated with high vs. low ratings?
14. Analyse session duration trends by app section and device.
15. Are crashes concentrated in certain states for specific app sections?
